

WAKE ONE

Wind it. Set it. Wear it.

Wake One runs on a modified Sellita SW200-1, a Swiss automatic movement that winds itself as you wear it. Everything happens through the screw-down crown, which has three positions. Here's how to get it running and set.

01

POSITION 1

Wind the movement

Unscrew the crown counterclockwise until it springs free. That's position 1. Turn it clockwise 20 times, until the seconds hand sweeps steadily.

Worn daily, Wake One keeps itself wound. The Canopy rotor you can see through the caseback does the work.

02

POSITION 2

Set the date

From position 1, pull the crown out to the first click and turn it clockwise until the correct date appears at 6 o'clock.

Don't set the date between about 8:30 PM and 2:00 AM. The date change is underway then, and the date may not advance the next day.

03

POSITION 3

Set the time

Pull the crown out to the second click. The seconds hand stops so you can set the time precisely. Turn to set the hour and minute.

The date changes at midnight. If it flips while you set the time, you're in AM; keep turning for PM. Then push the crown in and screw it down.

GOOD TO KNOW

Built to dive.

Modified Sellita SW200-1
Swiss automatic · 28,800 vph
Regulated to -4 / +6 sec/day

About 41 hours of reserve

Take it off Friday night and it should still be running Sunday morning. Past that, wind and set it again.

Timing with the bezel

Line the triangle up with the minute hand, then read elapsed minutes off the bezel. It only turns one way, so a knock can't cut your count short.

Screw it down before water

Wake One is rated to 200 meters only with the crown screwed down. Check it before you swim, and never operate the crown underwater.
